#### ABSTRACT

PURPOSE: To automatically adjust the presentation time of a medium by detecting a presentation time adjustment position with respect to a multimedium scenario which is synchronously set between arbitrary points.  
CONSTITUTION: Based on transferred editing information, a synchronous control part 5 transfers editing information to a scenario describing part 6 in the case of setting or release of synchronism and refers to a scenario information storage part 7 to transfer the change position and the changed presentation time to a correction control part 9 in the case of only the change of the presentation time of the medium due to the change of the reproducing speed or the data length. The scenario describing part 6 refers to the scenario information storage part 7 based on transferred editing information to describe a scenario by a network and transfers the identifier of the changed scenario to a detecting part 8. The detecting part 8 searches the network description of the scenario information storage part 7 based on the scenario identifier to detect the position where the presentation time adjustment is necessary.
